**Abstract**

Resurgence and exploration in traditional medicine (TM) is revived in 21st century with present resistant medical system in many diseases. Unani system of medicine (USM) is one of such vital element of TM with established age-long therapeutic values. *Cucumis sativus* Linn. (Family: Cucurbitaceae) commonly called as cucumber, Kheera or Khayarain in Unani. It is widely cultivated as a vegetable crop in India due to its nutritional as well as therapeutic value. Its seed pulp known as *Maghz e Tukhme Khayarain* are reported to possess wide therapeutic value as astringent, diuretic, coolent, analgesic, detergent, anti-inflammatory, anti-pyretic, deobstruent, laxative, calorific, blood purifier. It has been used in health ailments like to quench thirst, urolithiasis, correct imbalanced humors, sanguinous inflammation, remove obstructions, cystitis, diabetes, bronchitis, diarrhoea and renal diseases, bilious diseases (*Musakkin safra* - coolent property) and in sanguinous diseases (as *Musakkin hiddat e dam*). This wide therapeutic value is due to the secondary metabolites and phyto-constituents, which acts synergistically when used as whole. It contains cucurbitacin A, B, C and D, ascorbic acid, laetic acid, flavanoid-fisetin, lariciresinol, secoisolariciresinol, pinoresinol, saponin, hypo-xanthine and potassium. The classical literary evidence has also been confirmed by scientific studies to possess analgesic, anti-inflammatory, antimicrobial, antioxidant, diuretic, hypoglycemic, hepatoprotective, anti-carcinogenic, and wound healing activities. This study is aimed to provide a brief review of *Cucumis sativus* Linn. as mentioned in Unani ethno-botanical text and provide the pharmacological updates. It can be used for further scientific revalidation of the drug where it can be used efficiently for the mankind.

**Keywords**: *Cucumis melo*, Maghz-E-Tukhm Khayarain, unani system of medicine

**Introduction**

Nature has always provided with a beneficial source to the mankind, and thus the plant sources are healing man since its origin. Traditional system of medicine has always been a treasure of such natural sources which are economical, and available to every class of the society. But as per the need, synthetic drugs take the front foot due to their active outcome; simultaneously the fascinating therapeutic outcome leads to the long-term adverse effects, and increases the threshold. So, it is much needed to return back to the knowledge of nature, traditional medicines which were well acquainted with the original source of drugs. Active constituent isolated from the plant can show the outcome in seconds due to molecular approach, but the holistic approach of Unani medicine, consider the man as a whole. Therefore, since beginning, they emphasize holistic approach and the use of crude drugs or their extracts in compound formulations.

Present study is aimed to provide a detailed review on the Unani description of *Cucumis sativus*, its ethno-botanical description and provides the pharmacological updates.

**Plant nomenclature**

The term, ‘cucumis’ is derived from Greek word ‘kykyon’ and ‘sativus’ means ‘that is sown’. Cucumis in Latin means cucumber, which is the English common name of this genus. So, it is commonly known as Cucumber. In the Mediterranean era, it was confused with *Cucumis melo* and in some other civilization too, which was corrected later on. The main crop used includes the elongated fruits which are called as sikyos (Greek), cucumis (Latin), qishu’im (Hebrew), gherkins (English) and angarah (Persian). It is also mentioned in the Bible, apart from being included in Galenicals, writings of Egyptians and Romans [1].
Taxonomical classification

Kingdom: Plantae
Class: Magnoliopsida
Order: Cucurbitales
Family: Cucurbitaceae
Genus: Cucumis
Species: Sativus Linn [2].

Vernaculars [3].
It has been named as Khiyar means qasa bartang and also known as khiyarza, qasad and qasa. It’s seeds (tukhm) are known as khiyaraain, the food.

Arabic: Khiyaar, Qathadh, Bazrul qissa, Qasa ul himar, Bazr ul Qasad.
Bengali: Kakur, Karikuda, Shashaa.
Chinese: Huang ku.
English: Cucumber, Snake cucumber.
French: Concombre.
German: Gurke.
Gujrati: Kakadi.
Hindi: Kheera, Khira, Kakri.
Kashmiri: La’eer.
Kurudz: Khiyar badrang.
Kannada: Sauta.
Malayalam: Kammkadi, Vellarika.
Marathi: Kaksi, Kheera, Valanka.
Persian: Khayar, Khayarain, Khiyarza, Khiyaraj, Khiyar khar, Baadru, badrugh, Karanjak.
Punjabi: Kakri.
Sanskrit: Sakusa, Kandalu, Karkati.
Spanish: Pepino.
Tamil: Kakkarikkay, Vellarikkai.
Telugu: Dosakaya.
Urdu: Kheera, Kakri.

C. sativus (Kheera) and C. melo (Kakdi)
There is morphological similarity found in the seeds of C. sativus (Maghz tukhm-e-khyaraain) and C. melo (Maghz tukhm-e-kharpaaza).

- Main plant can be distinguished on the basis of leaves, as C. sativus bears broader leaves than C. melo. The stem of C. sativus is big and broad in size, coiled, covered with thin hairs as compared to C. melo; new thin soft stems of C. sativus have fine hairs.
- Seeds of C. melo are known as khyara in Persian and shakhaaz in Tibrezi. These are white and heavy, best quality of their seeds is obtained from fully ripened C. melo.
- C. sativus is more indigestible in comparison to C. melo, it is attributed to the variation in temperament also in Unani texts as C. sativus temperament is cold in last of second degree whereas temperament of C. melo is cold in mid of second degree.
- Pulp of cucumber is easily digestible, in comparison to C. melo.

Habit and Habitat
It is a climber that grows in moist, sandy soil under full sunlight exposure in humid climate. Good quality of the plant needs soil, rich in organic matter and slightly alkaline.

It was thought to be originated 3000 years ago in the Indian sub-continent up to 1200 m altitude, then spread towards China. It grows and cultivated in both tropical and subtropical regions, warm temperate climates throughout the world and is very important economically [4].

Morphological description of C. sativus

Cucumis sativus Linn. from Cucurbitaceae/Guard family is a vegetable crop, cultivated widely for its commercial and therapeutic value. It is an annual, climbing vine, grows up to 2m high with the plant climbs through the coiled tendrils on nearby plants and trees or is found to be scattered on the ground [5].

Stem: Prostrate stem, angular, white pubescent which encircles thin un-branched axillary tendrils of about 30 cm long around for the support.

Stipules: Absent but have stiff hairs.

Leaves: They are simple, pubescent, basally cordate, acute apically with 3-7 palmate lobes seems orbicular 7-20 cm long and broad with serrated margins. Arranged alternately on 10-16 (-20) cm long petioles. They are acute with pentagon shape forming large form canopy with the fruit.

Flowers: Pubescent, pentamorous with 0.5-1 cm long white, long, narrow, acute sepalas. They get fused with the ovary and form hypanthydium. The petals are 2cm long, 5-parted with oblong to lanceolate lobes, narrow, yellow, fused less than half of its length, campanulate. They have 3 staminodes, a pubescent, ellipsoid, unilocular ovary 2-5cm long, with a short style and 3 stigmas.

The staminate yellow colored flowers are solitary, yellow, pentamorous, axillary, monoecious or 3-7 on pubescent pedicels (0.5-2cm long), having three stamens (two celled-two anthers and one celled-one anther).

The pistillate flower are solitary or paired on pedicle which are shorter than staminate before the fruit development, and elongate up-to 5cm after fruit growth.

The flowers bloom around July to September in which staminate flower bloom first Pollination: Entmophilous: Entmophilous (honey bees).

Fruits: Pepo, a botanical berry with no internal divisions and hard outer rind. They are indesicent yellow to greenish colored glabrous cylindrical berries. It varies widely in length from 5-100cm in length and weight ranges from 50 g to 4kg with many seeds. One plant can yield up to 25 fruit [4].

Seeds (Tukhm Khiyaraain)

Macroscopical characters: They are smooth, glossy, creamish, white compressed of 0.7-1.0 cm x 0.3-0.4 cm size, sweet in taste, emarginated and elliptical with pointed ends. The seed coat is hard but breaks upon little pressure, get detached straight embryo with 2 elliptical off white, smooth, leathery textured cotyledons. A gram of seed includes 33-40 seeds [4].
Microscopical characters: The seeds are coated by whitish cream outer layer of round to oval shaped stone cells, lignified and striated. It is followed by a narrow zone of endosperm containing cellulose having thin aleuronic granules. The cotyledon shows leaf like structure with single layered epidermis, palisade layer, oval to polygonal compact spongy parenchyma and mesophyll.

Cut section of the two cotyledons inside, shows 2-3 layered straight cells in the epidermal layer with sclereids, it is followed by closely packed sclerenchymatous layer with numerous thick-walled cells. The inner layer have large oval to polygonal parenchymatous cells, small sized thin sclerenchymatous cells. The inner and lower epidermis is single layered. The cotyledonary cells are covered by thick cuticle, thin walled mesophyll cells arranged radially, elongated to square, parenchymatous, with numerous aleurone grains and oil globules. Its powder is creamish yellow and oily, shows stone cells, mesophyll cells, oil globules, aleurone grains.

Part used: Seed and Fruit C. sativus fruits vary in softness, seeds, color and length. Some are white, soft and delicate whereas others are up to one hand (1.125ft) length, with more pulp and less seeds [6]. Cucumber of small size are considered as good having thin seeds which are filled with thick-milk like fluid. The small, light and easily digest is the best. Medium size, hard and worm eaten, old are the worst. Seeds of C. sativus (Khiyarain) are mentioned to be of two types One called as Misri (Egyptian): greenish with striation and long and other as Shami (Syrian): Soft, easily digestible.

Temperament (Mizaj)
Unani text in reference of single drugs most often mentions a variation in the degree of temperament.
This is also observed in C. sativus
Cold, moist (3) [4,6,7], Cold and moist (2) [8,9], Cold and moist (2) [9], Cold moist (1)

Gilaní in Najmul Ghani mentioned, that its temperament is different from C. melo, as other authors assigned Kakri with cold and moist (3) [8].
It is beneficial for the hot temperamental people and people suffering from liver disorder. Even in small amount it provides freshness (Ghafqi). It is beneficial in diarrheaa, drowsiness, weakness, imbalance in consciousness (Isa bin masoya) [6,8].

Therapeutic dose
17.5-35 gm [8], 2-3 gm [4]; Some authors have mentioned it on the basis of maturity like in mature form (Kamil) 9gm-12gm and Immature form (Naqis) 4-6 gm [10].

Pharmacological profile
Astringent, detergent, diuretic, coolant, analgesic, detergent, anti-inflammatory, anti-pyretic, deobstruent, laxative, caloricific, blood purifier, emmenagogue, musakkin fawaq, mufkathe and muqatteh. It has been used to manage various health ailments like to quench thirst, urolithiasis, correct imbalance humors, sanguinous inflammation, remove obstructions, used in cystitis, diabetes, bronchitis, diarrhoea and renal diseases due to its coolant property for bilious diseases (Musakkin-i-safra) as well as hyperacidity in sanguine diseases (Muskkain-i-hiddat-i-dam) [7,8,11].

Therapeutic uses: It quench thirst, provide relief in productive and nonproductive cough, used in gastritis, pyrexia, lung abscess, cerebral and orbital edema, urinary tract infection, renal colic [6,9], biliary diarrhea, burning micturition, dysuria [10], celiac disease, skin health, dysentery, anti-helminthic. It relieves inflammation of liver, irregular bowel movements, infection, spleen caloric infection, headache, reproductive tract infection, arthralgia, appetizer, syphilis, phrenitis, palpitation, urticaaria [7,11].

Adverse effect (Muzir): It can be harmful to the nervous and stomach due to the prolonged gastric emptying time, as it is difficult to digest. It also causes some side effects when used in same temperament people like that of cold temperament [6-11]. Its toxicity may cause the putrification in humors. It is also reported to cause side effects to spleen [12], detrimental to spleen [9].

Correctives (Musleh): Honey (Asl) [8,9], Cuminum cyminum (Kamoon/cumin seeds), Foeniculum vulgare (Badiyaan) [9,12], Zingiber officinalis (Zanjabeel) [9,12], Jawarish-e-ood, Sikanjabeen [11].

Unani compound formulations: Jawarish zarooni sada, Sharbate bazoori, Banadiq ul buzuor, Qurs zardish, Qurs sartan, Qurs kafoor, Laboob barid, Laooq badaam, Laooq nazla etc. [13-14].

Phyto-chemical constituents
Sitosterol, stigmosta-7,22,25-trien -3β-ol,β Ethyl-31-norl-ansota-8, 25(27)-di-en-3β-ol; 24-β-Ethyl-25(27)-dehydrolophenol; multiflorol; isomuliflorol;α-andβ amyrrins; taxarerol; lupeol; cycloartenol; stigma sterol, campesterol, sitosterol 25(27)-dehydrocandinistilastrol; spinasterol; 24-β-ethyl-25(27) Dehydrolotheastrol; 24β-ethyl-25(27) dehydrolotheastrol; 24E, methyllathosterol and 22 dihydrosipninsterol [4].

Scientific studies
Thrombolytic and analgesic activity: Methanolic crude extract of C. sativus is reported to possess moderate thrombolytic activity (45.15%) while analgesic activity was

---

Fig 1: Seeds of C. sativus (Maghz Tukhn khiyarain)
found to be effective in comparison to aspirin and Pentazocine, it efficiently reduced the pain sensation [15].

**Anti-ulcer activity:** Ethanolic extract of cucumber showed significant ulcer protective effect in Wistar albino rat model [16].

**Antioxidant activity:** Aqueous extract of *Cucumis sativus* showed antioxidant activity which was evaluated in isolated rat hepatocytes against cumene hydroperoxide (CHP) induced-cytotoxicity and ROS formation [15].

**Anti-inflammatory activity:** *Cucumis sativus* L. showed anti-inflammatory activity in animal models and there was no dose dependent side effect as conventional drug [16].

**Cosmetic use:** Dermal application of *C. sativus*, prepared by homogenization of the fruit and expressing the juice, delayed the onset and decreased the incidence of tumors in a tumor promotion assay using DMBA and croton oil in mice. This study also depicts unusual mortality rate [19].

**Carminative and antacid properties:** Carbon dioxide evolution method and Rosette Rice test were used for the different doses of *C. sativus* extract, it demonstrated significant results for carminative properties and antacid effect. The study indicated neutralization of acid and resistance against alteration in pH [20].

**Anti-hyperlipidaemic activity:** The consumption of 500 mg of *C. sativus* seed extract daily showed significant reduction of serum total cholesterol, LDL-C and TG as well as significant increase of serum HDL-C in adult hyperlipidaemic patients [21].

**Antibacterial and cytotoxic activity:** *C. sativus* phosphate buffer solution (PBS) extracts has been found to possess more antibacterial and cytotoxic activity as compared to the aqueous extracts. Same PBS extracts were assayed against 2 cancer cell lines, the p53 deficient human non-small cell lung carcinoma cell line (H1299) and the estrogen dependent human breast adenocarcinoma cell line (MCF-7). The PBS pulp and peel showed activity against H1299 with IC50 of 42.0 and 52.0 mg/mL, respectively while the peels and pulp of PBS extracts exhibits anti-bacterial activity against gram positive (*S. aureus*) and gram negative (*K. pneumonia*) [22].

**Anti-hyperglycemic activity:** *C. sativus* is reported to be effective after a prolonged treatment in animal model, as it involves a different process of glucose metabolism, such as by decreasing plasma glucagon [23]. Prolonged treatment with its hydro alcoholic extract, it exhibited 22.5-33.8% improvement while the butanolic extract demonstrated 26.6-45.0%. It was found to be effective in decreasing blood glucose level and also control the loss of body weight in diabetic rats in comparison to control [24].

**Anti-ulcerative effect:** The aqueous extract of *C. sativus* L. was screened for its efficacy in experimentally induced bowel disease. It was found to possess significant pharmacological activity against ulcerative colitis [25].

**Wound healing effect:** Aqueous extracts of *C. sativus* is found to be significantly effective for wound healing. Herbal paste preparation from the drug has shown significant (*p<0.05*) enhancement on maturation, wound contraction and epithelialization [26].

**Conclusion**

Present study provides an insight of the detailed Unani description of *Cucumis sativus* with main emphasis on its seeds which are reported to possess wide therapeutic index, various scientific exploration of its activity also reconfirms the claims of Unani medicine. Still, there is an ample scope for future researchers to explore more out of it. This study will provide a baseline to study on seeds of *Cucumis sativus*.
